CLEAN VERSION OF ABSTRACT

RARE-EARTH DOPED PHOSPHATE-GLASS LASERS AND ASSOCIATED METHODS Applicant: Mark P. Bendett et al. Serial No.: 09/490,748

Abstract of the Disclosure

BI

Apparatus and method for integrating lasers and optics on glass substrates. An optical (e.g., laser) component formed from a glass substrate doped with a optically active lanthanides species with a plurality of waveguides defined by channels within the substrate. The laser component optionally includes a monolithic array of individual waveguides in which the waveguides form laser resonator cavities with differing resonance characteristics. Another aspect is directed toward pumping the laser wherein a superstrate waveguide cavity, or cladding, is positioned adjacent the substrate waveguide for supplying the latter with pump light. A closed crucible processing of optical waveguides on a glass substrate is also described. Waveguides are created by exposing a surface of the substrate to an ion-exchange solvent (e.g., a molten salt). A tightly sealed multipart crucible is provided in order that gas does not leak in or out of the crucible during cooling or heating of the system.
